LN.CNT 3032

The present invention concerns methods for the ex vivo formation of mammalian bone and subsequent uses of the bone. A critical and distinguishing feature of the present invention are defined tissue culture conditions and factors resulting in the formation of bone cell spheroids. The invention also provides for methods of implanting into subjects the ex vivo formed bone. Also described are methods for genetically altering the bone cell spheroids to affect bone formation, identification of candidate modulators of bone formation, and identification of genes involved in bone formation.

The present invention is directed to targeted therapeutic delivery systems comprising a gas or gaseous precursor filled microsphere wherein said gas or gaseous precursor filled microsphere comprises an oil, a surfactant, and a therapeutic compound. Methods of preparing the targeted therapeutic delivery systems are also embodied by the present invention which comprise processing a solution comprising an oil and a surfactant in the presence of a gaseous precursor, at a temperature below the gel to liquid crystalline phase transition temperature of the surfactant to form gas or gaseous precursor filled microsphere, and adding to said microspheres a therapeutic compound resulting in a targeted therapeutic delivery system, wherein said processing is selected from the group consisting of controlled agitation, controlled drying, and a combination thereof.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

The present invention is directed to a solid porous matrix comprising a solvent and a surfactant in combination with a bioactive agent. The solvent and the surfactant may, if desired, form vesicles, an agglomeration of which comprises the matrix. The composition optionally comprises a gas or a gaseous precursor. The emulsion may be dried, and subsequently reconstituted in an aqueous or organic solution.

The present invention is also directed to a method of preparing a solid porous matrix comprising combining a solvent, a surfactant, and a therapeutic to form an emulsion; and processing the emulsion by controlled drying, or controlled agitation and controlled drying to form a solid porous matrix. The resulting solid porous matrix may also comprise a gas or gaseous precursor and be added to a resuspending medium.

A method for the controlled delivery of a targeted therapeutic to a region of a patient is another embodiment of the present invention. The method comprises administering to the patient a composition having a solid porous matrix comprising a solvent, a surfactant, a therapeutic, and a gas or gaseous precursor, monitoring the composition using energy to determine the presence of the composition in the region; and releasing the therapeutic from the composition in the region using energy.

The present invention describes, among other things, the surprising discovery that gaseous precursor filled compositions are profoundly more effective as acoustically active contrast agents when they are thermally preactivated to temperatures at or above the boiling point of the instilled gaseous precursor prior to their in vivo administration to a patient. Further optimization of contrast enhancement is achieved by administering the gaseous precursor filled compositions to a patient as an infusion. Enhanced effectiveness is also achieved for ultrasound mediated targeting and drug delivery.

       The invention provides a composition and method for treating benign
AΒ
       prostatic hypertrophy in mammals so as to cause the dissolution and
       regression of hypertrophied prostatic tissue and thereby provide relief
       from the obstructive symptoms associated with the disease. The present
       composition preferably comprises a sterile pyrogen-free solution of the
       hydrolytic enzymes collagenase and hyaluronidase, a nonionic surfactant,
       and an antibiotic; all provided, in a pharmaceutically acceptable,
       buffered, isotonic, aqueous carrier. The present method preferably
       comprises the direct intraprostatic injection of a safe and
       therapeutically effective dose of the composition via the transurethral
       route of administration.
CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
       Formulations for controlled, prolonged release of GM-CSF have been
AB
       developed. These are based on solid microparticles formed of the
       combination of biodegradable, synthetic polymers such as poly(lactic
       acid) (PLA), poly(glycolic acid) (PGA), and copolymers thereof with
       excipients and drug loadings that yield zero order or first order
       release, or multiphasic release over a period of approximately three to
       twenty one days, preferably one week, when administered by injection. In
       the preferred embodiment, the microparticles are microspheres having
       diameters in the range of 10 to 60 microns, formed of a blend of PLGA
       having different molecular weights, most preferably 6,000, 30,000 and
       41,000. Other embodiments have been developed to alter the release
       kinetics or the manner in which the drug is distributed in vivo. For
       example, in some cases a polymer is selected which elicits a mild
       inflammatory reaction, for example, PLGA and polyanhydrides can act as
       chemoattractant, either due to the polymer itself or minor contaminants
       in the polymer, or polymers which are bioadhesive are used for
       transmucosal or oral delivery. In another embodiment, the GM-CSF is
       administered in a hydrogel which can be injected subcutaneous or at a
       specific site for controlled release. The microparticles or hydrogel are
       administered to the patient in an amount effect to stimulate
       proliferation of hematopoietic cells, especially white cells.
CAS INDEXING IS AVAILABLE FOR THIS PATENT.

The present invention relates to compositions containing an autocross-linked form of hyaluronic acid as a first component in a mixture with a second component noncross-linked hyaluronic acid, and possibly also in combination with another pharmacologically active substance. These compositions can be used in the treatment of arthropathies due to their unique viscoelastic properties.

       Polymers are provided comprising protein polymers comprising blocks of
AΒ
```

Polymers are provided comprising protein polymers comprising blocks of repeating units and sequences comprising amino acids, individually or in defined sequences, capable of enzyme catalyzed covalent bond formation for cross-linking, as exemplified by glutamine and/or lysine reactive for FXIII catalyzed isopeptide formation or non-amino acid polymers having side chains comprising such amino acids or sequences, which may be used for preparation of articles of manufacture, particularly cross-linkable compositions. By appropriate choice of the polymer, resorbable implantable polymers may be used in internal applications for mammals as formed objects or depots.

Inter and/or intramolecular cross-linked esters of acid
       polysaccharides are disclosed in which a part or all of the
       carboxy groups are esterified with hydroxyl groups of the same
       molecule and/or of different molecules of the acid
       polysaccharide. These inner cross-linked esters of
       polysaccharide acids are useful in the field of biodegradable
       plastic materials, to manufacture sanitary and surgical articles, in the
       cosmetic and pharmaceutical fields, in the food industry and in many
       other industrial fields.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
       The invention provides a composition and method for treating benign
AR
       prostatic hypertropy in mammals so as to cause the dissolution and
       regression of hypertrophied prostatic tissue and thereby provide relief
       from the obstructive symptoms associated with the disease. The present
       composition preferably comprises a sterile pyrogen-free solution of the
       hydrolytic enzymes collagenase and hyaluronidase, a nonionic surfactant,
       and an antibiotic; all provided, in a pharmaceutically acceptable,
       buffered, isotonic, aqueous carrier. The present method preferably
       comprises the direct intraprostatic injection of a safe and
       therapeutically effective dose of the composition via the transurethral
       route of administration.

The present invention provides novel polynucleotides encoding Drosophila DmTNF polypeptides, fragments and homologs thereof. The present invention also is directed to novel polynucleotides encoding two Drosophila DmTNF variants, DmTNFv1 and DmTNFv2 polypeptides, fragments and homologs thereof. Also provided are vectors, host cells, antibodies, and recombinant and synthetic methods for producing said polypeptides. The invention further relates to screening methods for identifying agonists and antagonists of the polynucleotides and polypeptides of the present invention, in addition to methods of genetically modifying Drosophila or cultured cells to express or mis-express DmTNF, DmTNFv1, or DmTNFv2. The invention also relates to the use of such modified insects or cells to characterize DmTNF activity, identify TNF-like genes and/or genes implicated in modulating TNF, characterize TNF signaling pathways, and/or to identify modulators of DmTNF activity.
